TITLE : Study of Sulfamides. XIV. Conductometric
Study of o-, m-, and p-Amino-Benzoyhydrazides
in Comparison with Sulfamides and Benzamides
ORIG. PUB. : Studii si cercetari chim. Acad. RPR Fil.
Cluj, 1958, 9, No 1-4, 137-154
ABSTRACT : On conductometric titration (CT) of o-, m-,
and p-amino-benzoyhydrazides (I) in alcohol solution with
aqueous NaOH, identical curves were obtained, with two
inflection points characterizing the hydrolysis of the amine
function. The curves obtained are analogous to the CT curves
of amino-benzosulfamides (II) and amino-benzamides (III).
In contradistinction to II and III the rate of hydrolysis
of I increases from ortho- to the para-derivative. In the
case of p-I the titration curve becomes a straight line,
which indicates, probably, a complete hydrolysis. In the
case of an excess of aqueous NaOH, and a back-titration
of p-I in alcoholic, aqueous-alcohol, and aqueous acetone

S/139/60/000/01/012/041
E073/E435**24,7500****AUTHORS:**Savintsev, P.A. and Botaki, A.A.**TITLE:****Modulus of Elasticity of Alkali Haloid and Metallic Alloys****PERIODICAL:****Izvestiya vysshikh uchebnykh zavedeniy, Fizika,**
1960, Nr 1, pp 68-72 (USSR)**ABSTRACT:**

Numerous physical properties of crystals are determined by the interaction of the atoms of the crystal lattice. It is therefore of interest to measure physical constants which characterize the relation between individual particles of the lattice, these constants include the modulus of elasticity of the crystals. By using ultrasonic methods it is possible to determine the Young modulus more accurately than by static methods. The authors of this paper measured the Young modulus by means of a piezo-quartz resonator consisting of a piezo-quartz rod to the end of which a sound-conducting rod was glued, by means of shellac, and then the investigated specimen. The Young modulus was determined for alkali haloid crystals and their

Modulus of Elasticity of Alkali Haloid and Metallic Alloys

solid solutions, and also for a number of metals and alloys. In table 1, the thus-determined Young modulus of haloid single crystals is compared with the energy of the crystal lattice U , the molecular concentration α , the microhardness, and the hardness: it can be seen that for Na and K compounds U , α , the microhardness and the hardness increase with increasing value of the Young modulus. In Table 2, the Young modulus values are entered for single crystals of the solid solutions $\text{NaBr}-\text{NaCl}$, $\text{NaBr}-\text{KBr}$, $\text{KBr}-\text{KCl}$; in these systems the Young modulus is smaller than the respective additive value. This is in agreement with other properties of the considered equimolar alloys, entered in Table 3. In the case of the eutectic systems Pb-Sn , Pb-Sb , Pb-Cd , Sn-Cd , Sn-Bi , Cd-Zn (entered in Table 4), the measured values of the Young modulus are identical with the sum of the additive values. The following conclusions are arrived at:

- 1) Formation of the solid solutions $\text{NaBr}-\text{KBr}$,

TITLE: Changes in the modulus of elasticity and microhardness
with exposure (to radiation)PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Fizika.
no.6, 1961, 30-34

TEXT: It is well known that radiation causes changes in crystalline systems. In particular, irradiation with electrons increases the Young's modulus of various metals up to a limiting value. Similarly, irradiation of single crystals of copper with γ -radiation produces an increase in the modulus of elasticity. In addition, the Young's modulus for graphite and single crystals of copper is substantially increased by irradiation with neutrons in a reactor. In this paper it is shown that the modulus of elasticity of the eutectic alloy Zn-Cd increases by about 2.5% after storage for one year after preparation, whereas in the case of Pb-Bi the modulus increases by about 6% after 45 hours. These changes in Young's modulus were determined by an ultrasonic method. The effect of exposure to slow neutrons and γ -radiation from a

Card 1/4

E039/E420

Changes in the modulus ...

radium beryllium source (4.8×10^6 n sec) on the Young's modulus for bismuth and tin was also examined. A maximum increase of about 1% is reached after 70 and 100 hours exposure respectively (Fig. 2,3). The effect of irradiation by high energy γ -radiation (15 MeV) on bismuth and tin is similar, showing an increase in modulus of about 2% after a few hours exposure. In the case of rock salt a dose of 3000 r (25 MeV γ) increased the Young's modulus by about 1%. The change in Young's modulus ΔE caused by irradiation of Zn-Cd alloys of various Zn content to X-radiation is shown in Fig.5. ΔE passes through a sharp maximum at about 29% Zn. An exposure of 30 min to 1.2 MeV γ -radiation changed the microhardness of the Bi-Pb alloy from 3.05 to 5.52 kg/mm² and for the Bi-Sn alloy from 4.10 to 6.60 after 25 hours. In the case of Zn-Cd, an exposure to 130 r/min of 48 kV X-rays resulted in an increase in microhardness from 24.4 kg/mm² to a maximum of 30.2 kg/mm² after 2 hours, after which it fell rapidly to near its normal value. There are 5 figures, 4 tables and 14 references: 3 Soviet and 11 non-Soviet-bloc.

TITLE: Temperature variations of Young's modulus of alkali-halide crystals ^B

SOURCE: IVUZ. Fizika, no. 4, 1965, 92-95 ¹⁷

TOPIC TAGS: Young modulus, temperature dependence, alkali halide, single crystal, measurement apparatus, ultrasonic velocity ^{44, 55}

ABSTRACT: The author describes apparatus for remote measurement of Young's modulus. The apparatus is based on the Quimby method (S. L. Quimby, Phys. Rev. v. 25, 558, 1925). A block diagram of the apparatus is shown in Fig. 1 of the Enclosure. The measurements can be carried out up to 20 meters from the sample. The apparatus was used to investigate the temperature dependence of Young's modulus and of the velocity of ultrasound in single crystals of LiF, NaCl, NaBr, KCl, KBr, and KI at temperatures from 0 to 110°C. The single crystals were grown by the Kropoulos method and were cleaved along the (001) surface. The results showed that for alkali-halide compounds of sodium and potassium, the value of $-dE/dT$ decreases linearly with decreasing crystal-lattice energy. The ultrasonic velocity was also found to vary linearly with the temperature, in spite of the fact that such a linear variation is

Card 1/3

"Changes in the Sympathetic Ganglia in Bronchial Asthma."

Budapest, Orvosi Hetilap, Vol 104, No 27, 7 July 1963, pages 1266-1269.

Abstract: [Authors' Hungarian summary modified] Qualitative and quantitative methods have been used for the examination of the 2-5 thoracic sympathetic ganglia removed surgically from nine patients (18-52 years) suffering from severe bronchial asthma. The ganglia contained young nerve cells (40 per cent) and mature nerve cells (60 per cent) mixed. About half of both kinds of cells showed pathological changes. The quantity of changed cells was in proportion to the severity of the disease. In the immature cells, increased lipoid granulation alone was found. Among the mature cells, stem hypertrophy, hyperplasia, vacuola and fenestrated cells were also found. The changes seem to be secondary, produced probably by prolonged hypoxia, fever, etc. connected with the disease. 2 Hungarian, 8 Western references.

✓ 80. Qualitative and quantitative research on nerve cells of cochlear ganglion in old age. J. Botar *Acta Anat.*, Basel, 1958, 29, 157-206 (Staatliches Inst., Budapest, Hungary).—The density and

size of nerve cells of the cochlear ganglion of old age is compared with that of young men. The silver impregnation method of Bielschowsky-Gros and qual and quant methods were employed. Young nerve cells are absent and mature, healthy cells reduced in number in old age. Argyrophil connective tissue shows indication of senility. (German)

CHANGES IN THE ORGAN INNERVATION WITH REFERENCE TO AGE, TO EXPERIMENTAL EFFECTS AND TO DISEASES - Physiologisch-morphologische Untersuchungen über die Innervation des Nebennierenmarkes beim Hund. Veränderungen der Organinnervation in Beziehung zum Alter, zu experimentellen Einwirkungen auf den Organismus und zu Krankheiten - Botar J. Staatl. Inst. für Neurol. und Psychiat., Budapest - ACTA ANAT.

1958, 35/suppl. 33 (5-88) Illus. 32
In test groups of 4-6 dogs the innervation of the medulla of the suprarenal gland was studied histologically, with application of the silver impregnation according to Bielschowsky-Gross, in new-born, young and old animals and in young animals after experimentally induced general pathological reactions (fever, deprivation of food, hypoxaemia and avitaminosis). It was established that the nervous system transmitting the impulses does not form an invariable, static structure, but that it reacts very sensitively to the changes in the organism and in its environment as a dynamic, living structure; through the general pathological reactions the organ innervation suffers decisive changes of a regressive character. SOURCE: Acta chimica academiae scientiarum Hungaricae, v. 44, no. 3, 1965, 293-299

TOPIC TAGS: radiolysis, dissociation constant, redox reaction

ABSTRACT: Acid-base dissociation constants for H, H₂, OH, and HO₂ were calculated on the basis of the appropriate oxidation-reduction half reactions using standard thermodynamic methods. The formal half reaction: e_{aq}⁻ aq + e⁻ was introduced for the calculation of K_H. The importance of these equilibrium processes in the radiolysis of aqueous solutions is discussed. S/2757/62/000/002/0305/0322

AUTHOR: Botashev, A. I.

TITLE: Application of the Ditkin operational calculus to differential and integro-differential equations

SOURCE: AN KirgSSR. Institut fiziki, matematiki i mekhaniki. Issledovaniya po integro-differentsial'nym uravneniyam v Kirgizii, no. 2, 1962, 305-322

TOPIC TAGS: operational calculus, Ditkin operational calculus, Mikusinski operational calculus, differential equation, integrodifferential equation, general solution

ABSTRACT: A general solution is constructed for the equation

$$L(D_t)y(t) = f(t), \quad (1.1)$$

where

Card 1/3

ACCESSION NR: AT3013108

$$L(t) = \sum_{k=0}^n a_k t^k; \quad D_t = \frac{d}{dt} t \frac{d}{dt};$$

and a_k are some coefficients. An operational calculus for the operator D_t was developed by V. A. Ditkin (DAN SSSR v. 116, 1957), who used a scheme of J. Mikusinski (Operatornoje ischisleniye, IL, 1956). However, direct application of Ditkin's method yields only n solutions if the related homogeneous equation

$$L(D_t)y(t)=0 \quad (1.1_1)$$

has derivatives of order $2n$. Additional considerations with which to obtain all the solutions are presented. Applications to differential and integro-differential equations are demonstrated. Orig. art. has: 27 formulas.

ABSTRACT: The sulfidization process of Sn-bearing materials was investigated on a laboratory scale. It is established that 97-98 percent of Sn may be extracted in the form of sulfides from lean Sn-bearing materials by heating the latter under a vacuum to a temperature of 1050°. The sublimes are easily collectible (up to 70-85 percent are collected); they constitute pure monosulfide of Sn.

Prague, Pracovni Lekarstvi, Vol 19, No 2, Mar 67, pp 63 - 67

Abstract /Authors' English summary modified/7: During seed dressing by dry powder pickling compounds, dust concentration in the working shops reaches 200 mg/ cm. Safe levels for Hg containing compounds are 0.84 mg of Hg / cm; for lindane 0.05 mg / cm. The main source of dust is the bagging operation. During cold spells the temperature in the working shops was only 1.5° to 6°C. It is recommended that only automatic bagging machines be used in this process and that forced ventilation be provided at all plants. 7 Figures, 1 Western, 4 Czech, 1 USSR reference.
